File Format to Upload Game Results to ASL Player Ratings

Game Results need to be in a .csv file format. Virtually every spreadsheet program allows data to be saved/exported to a .csv format.

TD's should use their preferred spreadsheet tool for tracking results and then export it to a .csv.

Each game result should be structured with the following columns in the order listed. Data can be omitted and columns left blank but the columns should still exist. Only those proceeded by (M) are mandatory requirements; everything else is nice to have.

(M)   Tournament ID – this will be listed on the site and is generally in a form like "ASLOK_15"
         Round No. – usually 1-5; otherwise leave blank
         Blank column – needs to be included
         Scenario ID – standard ID and name (e.g. J62 Lee's Charge)
(M)   1st Player Name – using the player name found in ASL Player Ratings
         1st Player Attacker or Defender – using "attacker" or "defender"
         1st Player Side – using "Allies" or "Axis"
(M)   1st Player Result – using "win", "loss", or "draw"
(M)   2nd Player Name – using the player name found in ASL Player Ratings
         2nd Player Attacker or Defender – using "attacker" or "defender"
         2nd Player Side – using "Allied" or "Axis"
(M)   2nd Player Result – using "win", "loss", or "draw"
(M)   Date – date the game was played in the format yyyy-mm-dd

A complete example, in .csv format, would be:

AnyT_20, 1, , ASL1 Fighting Withdrawl, Any Player, attacker, Allies, win, Another Player, defender, Axis, loss, 2020-06-15

An example with just the mandatory information would be:

AnyT_20, , , , Any Player, , , win, Another Player, , , loss, 2020-06-15
